Site Update

WOW!! I got hammered with orders for the new year, but I am all caught up now after like six weeks! Some orders went out a week later which is pretty darn late for me... 30 orders in one day is sort of EXTREME!!!

But it is all cool now and orders would get sent a more quick (normal) now! :D

Mail Returns

If you write me and I don't seem to write back (I always do!) check your spam folders or block lists. Some places like Google mail and Yahoo are so paranoid about spam that they don't let 'anyone' respond to you anymore that they don't recognize. The spam filters are as poor now as they were 5 and 10 years ago (almost useless...). I can't help it if your mail service does not allow folks to write back to you without destroying your e-mail. I have alternate e-mails too.

I get a LOT of spam into the main mail... I crunch through it... If I accident and kill your mail please write back! I think I know how to spam filter "manually", but mistakes happen...

Mail servers are also wierd... So always try writing again if something does not go through.

New Products

SW-SF

This is a poly fuse version of the SW-S. I added poly fuses and screw connectors too. It seems indestructible! I can make it in both 20 and 30 amp versions

SW-SF-II

This is a poly fuse version of the SW-S but now with positive terminal connections too. This makes it easier to wire in since it takes care of the positive wire connections too. It is also in the same connection format now as the Cheetah and Jaguar units. I can make it in both 20 and 30 amp versions. Been a pretty hot seller!!

SW-UCM

This is a computer module to fix the micro-switch problem. Yes it is overkill, but it works! I made it very universal so it can do other odd jobs too. It is suprisingly popular to fix those darn micro switches. Seems to be working perfect!!

SW-LION

If you know the history you know it all anyway :D But I do now actually officially sell it. I still need to fix the "official" software but the hardware is ready for anyone that knows what to do with it.

SW-TERM-FUSE

Just a 20/30 amps poly fuse with screw terminals. I need to get the fuse pages fixed... Still..... :(

WEBSITE

Needs some work... :D Old old links are still there in any case.
